

Centering Indigenous Fisheries in '4R' Research, Teaching and Outreach

04/21/2021

Dr. Andrea Reid

Dr. Andrea Reid is an Indigenous fisheries scientist who employs community-based approaches and Indigenous research methodologies in her study of culturally significant fish and fisheries. Her freshwater and coastal research creates space for fishers, knowledge keepers, youth, and other community members to be full partners in the research process. Together, they investigate: (i) leading threats to aquatic ecosystems and their interactive effects for fish, people and place; (ii) consequences of fisheries-related stressors for fish and methods to ameliorate survival; (iii) Two-Eyed Seeing approaches to assessing aquatic ecosystem and fish health and evaluating associated changes through time and space; and (iv) Indigenous understandings and methodologies for effectively stewarding fish and waterways.
